ART UNIT	PAPER NUMBER
2822	

DATE MAILED: 11/05/2002

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary	Application No. 09/059,644	Applicant(s) PAN, PAI-HUNG	
	Examiner Michael M Trinh	Art Unit 2822	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

1)☒ Responsive to communication(s) filed on *08 August 2002* .

2a)☒ This action is **FINAL**. 2b)☐ This action is non-final.

3)☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4)☒ Claim(s) *41 and 43-70* is/are pending in the application.

4a) Of the above claim(s) _____ is/are withdrawn from consideration.

5)☐ Claim(s) _____ is/are allowed.

6)☒ Claim(s) *41 and 43-70* is/are rejected.

7)☐ Claim(s) _____ is/are objected to.

8)☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

9)☐ The specification is objected to by the Examiner.

10)☐ The drawing(s) filed on _____ is/are: a)☐ accepted or b)☐ objected to by the Examiner.

Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).

11)☐ The proposed drawing correction filed on _____ is: a)☐ approved b)☐ disapproved by the Examiner.

If approved, corrected drawings are required in reply to this Office action.

12)☐ The oath or declaration is objected to by the Examiner.

Priority under 35 U.S.C. §§ 119 and 120

13)☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

a)☐ All b)☐ Some * c)☐ None of:

1.☐ Certified copies of the priority documents have been received.

2.☐ Certified copies of the priority documents have been received in Application No. _____ .

3.☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

14)☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application).

a) ☐ The translation of the foreign language provisional application has been received.

15)☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

Attachment(s)

1) ☐ Notice of References Cited (PTO-892)
2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
3) ☒ Information Disclosure Statement(s) (PTO-1449) Paper No(s) *29* .
4) ☐ Interview Summary (PTO-413) Paper No(s). _____ .
5) ☐ Notice of Informal Patent Application (PTO-152)
6) ☐ Other: .

DETAILED ACTION

*** This office action is in response to Applicant's Amendment filed on March 04, 2002. Claims 41,43-53,54-70 are pending, in which claims 54-70 have been newly added.

*** The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

Claim Rejections - 35 USC § 112

1. Claims 63-70 are rejected under 35 U.S.C. 112, first paragraph, as containing subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention.

** Re base claim 63: Original specification does not teach method of claim 63, wherein the gate having an interface with the gate dielectric layer, the gate including a metal nitride layer, ..., and to oxidize at least a portion of the gate interface with the gate dielectric layer. As originally disclosed and shown in Figure 8, the metal nitride layer 28 is not interface with the gate dielectric layer, and not be oxidized to form a smiling gate.

** Re claims 64 and 65: Original specification does not teach a gate structure including the metal nitride layer (as base claim 63), and comprising a first conductive polysilicon layer, an electrically conductive reaction barrier layer atop the polysilicon layer and an overlying metal layer (as further in claims 64 and 65).

** Re claims 69-70: As shown, an oxidation resist material 30 (Fig 1) is formed on the top of the gate electrode at the beginning, and before forming the nitride layer 23 (Fig 2) and the nitride spacers (Fig 3). Original specification does not describe "...prior to exposing the substrate to the oxidizing conditions, forming an oxidation resistant material over the gate top...", since it would include to form the oxidation resist material after forming the nitride spacers and still prior to exposing the substrate to the oxidizing conditions.

(Dependent claims are rejected as depending on rejected base claim)

Claim Rejections - 35 USC § 102/103

2. Claims 41,45,46,50,55,58,59 are rejected under 35 U.S.C. 102(b) as being anticipated by Kurimoto (5,306,655).

Kurimoto teaches a method (at Figs 13a-13h; col 13, line 21 through col 16) for forming a conductive gate of a metal oxide transistor comprising the steps of: forming a gate str3ucture having a polysilicon gate electrode 5f formed on a gate oxide dielectric layer 2 formed on a semiconductor substrate (figs 13a; col 13, lines 30+); forming barrier sidewall nitride spacers 10 over sidewalls of the gate electrode and joining the dielectric oxide layer 2 by anisotropically etching a silicon nitride layer 10 (figs 13C-13D), which the nitride spacers 10 are considered to be formed on, laterally adjacent, laterally abutting, or adjoining the gate electrode; and then oxidizing the substrate to channel oxidants through the gate dielectric layer 2 and underneath the spacers joined therewith and which is outwardly exposed laterally proximate the sidewall spacers, wherein only a portion of the gate electrode 5f, laterally adjacent the sidewall spacers and at the interface with the gate dielectric oxide layer 2 is oxidized (Fig 13f), while preventing oxidation of the upper parts of side faces of the gate electrode 5f by the action of the barrier insulating nitride spacers 10 (col 13, lines 59-68), wherein as recited at column 18, lines 4-21, a third insulating film consisting of material which is not readily permeable to oxygen is formed over the gate electrode, wherein an intervening oxide layer is not formed between the gate electrode and the third insulating film.

3. Claims 41,45,46,50,55,58,59 are rejected under 35 U.S.C. 102(b) as being anticipated by, or in the alternative under 35 USC 103 (a) as unpatentable over Verhaar (5,015,598) with Hiroki et al (5,512,771) as an evidence also.

Verhaar teaches a method (at Figs 1-5; col 4, line 30 through col 5) for forming a conductive gate of a metal oxide transistor comprising the steps of: forming a gate structure having a polysilicon gate electrode 12 formed on a gate oxide dielectric layer 11 formed on a semiconductor substrate 10 (col 4); forming barrier sidewall nitride spacers 20a laterally adjacent the sidewalls of the gate electrode 12 and joining the dielectric oxide layer 10 by anisotropically etching a silicon nitride layer 20 (col 4, lines 45-49; col 5, lines 10-52); and then oxidizing the substrate to channel oxidants through the gate dielectric layer 10 (col 5, lines 47-52) and underneath the spacers joined therewith and which is outwardly exposed laterally proximate the sidewall spacers, wherein only a portion of the gate electrode 12, laterally adjacent the sidewall spacers and at the interface with the gate dielectric oxide layer 10 is oxidized (Fig 5), while

preventing oxidation of the upper parts of side faces of the gate electrode 12 by the action of the barrier insulating nitride spacers 10. Since Verhaar discloses forming the silicon nitride spacers 20a having a thickness between 15 and 50 nm and preferably close to 30 nm (col 4, lines 63-68) adjacent to the gate electrode 12; and since oxidizing at 900°C for a duration of 15 to 30 minutes in oxygen to form a silicon oxide layer 24 (fig 5) having a thickness of the order of 10 to 15 nm (100 to 150 Angstroms), only a portion only a portion of the gate electrode 12, laterally adjacent the sidewall spacers and at the interface with the gate dielectric oxide layer 10 is inherently oxidized and creating a "smiling gate" (can be seen by enlarging the gate electrode), wherein as shown from Figures 4 to 6 of Verhaar, after forming spacers 20a and prior to forming source and drain regions 22a,23a (Fig 6), exposing the substrate to oxidizing conditions to create a "smiling gate" (Figs 4-6). It is the fact that the present specification discloses (at page 7, lines 14-19) that only portion of the gate electrode is oxidized in a time period for growing "an oxide layer over a separate semiconductor substrate to a thickness of a round 80 Angstroms". Herein, since Verhaar grows a silicon oxide layer 24 having a thicker thickness of 100 to 150 Angstroms, only a portion of the gate electrode, laterally adjacent the sidewall spacers and at the interface with the gate dielectric oxide layer 10, is inherently oxidized ("smiling gate"). Consequently, the burden shifted to applicant to demonstrate and prove that this apparent inherence does not in fact exist, In re King, 801 F.2d 1324, 1327, 231 USPQ 136, 138-139 (Fed. Cir. 1986).

Regarding 102 rejection, Hiroki et al (5,512,771) is evidently cited to show that the oxide layer 6' formed under the silicon nitride spacer 7 allows oxidizing substance to transmit therethrough to oxidize a portion of the gate electrode to form a "smiling gate" (col 12, lines 10-21; figs 6A-6B).

Regarding 103 rejection, as in the alternative: Hiroki et al (5,512,771) teach to form a "smiling gate" by oxidizing a portion of the gate electrode, laterally adjacent the sidewall spacers and at the interface with the gate dielectric layer, wherein the oxide layer 6' underlying the silicon nitride spacer 7 allows oxidizing substance to transmit therethrough to oxidize a portion of the gate electrode to form a "smiling gate" (col 12, lines 10-21; figs 6A-6B), wherein as shown from Figure 6A to Figure 6D of Hiroki, after forming spacers and prior to forming source and drain regions 3 (Fig 6D; col 12), exposing the substrate to oxidizing conditions to create a "smiling gate" (Figs 6B-6C). Thus, it would have been obvious to one of ordinary skill in the

art to create a "smiling gate" as taught by Hiroki et al by oxidizing a portion of the gate electrode of Verhaar, wherein a portion of the oxide layer 11 underlying the spacers 20a as shown in figure 11 allows oxidizing substance to transmit therethrough to oxidize a portion of the gate electrode to form a "smiling gate". This is because of the desirability to have smaller gate-to-drain capacitance and thus to improve the speed of the circuit operation (col 8, lines 45-67; fig 2).

Claim Rejections - 35 USC § 103

4. Claims 43,47,56,60,63-65 are rejected under 35 U.S.C. § 103(a) as being unpatentable over either Verhaar/Hiroki et al OR Kurimoto (5,306,655), in view of Pintchovski et al (5,126,283).

Verhaar/Hiroki already teaches a method for forming a conductive gate of a metal oxide transistor as applied above to claims 41,45,46,50. Kurimoto teaches a method for forming a semiconductor device as applied above to claims 45,46.

Either Verhaar/ Hiroki or Kurimoto lack to form a gate electrode having a polysilicon, a conductive reaction barrier metal nitride layer, and an overlying metal (re claims 43,47).

However, Pintchovski et al teach (at figs 3a-3c; col 5, line 60 through col 6, line 45) to alternatively form a gate electrode having a polysilicon layer 38, a conductive reaction barrier metal nitride layer 40, and an overlying metal 42.

The subject matter would have been obvious to one of ordinary skill in the art at the time the invention was made to modify Verhaar/ Hiroki or Kurimoto by forming a multi-layered transistor gate electrode as taught by Pintchovski et al. This is because of the desirability to fabricate high speed devices due to high conductivity of the gate electrode, wherein the conductive reaction barrier metal nitride layer acts as a diffusion barrier.

5. Claims 44,48,49,51-54,57,61-62,66-67, are rejected under 35 U.S.C. § 103(a) as being unpatentable over either Verhaar/Hiroki et al (5015598 & 5512771) OR Kurimoto (5,306,655) in view of Pintchovski et al (5,126,283), as applied to claims 41,43,45-47,50 above, and further of Brigham et al (5,714,413) and Kumagai et al (5,430,313).

Verhaar/Hiroki or Kurimoto already teaches to form single sidewall barrier spacers over sidewalls of the gate (similarly to a first embodiment of the present invention as shown in figure 3 having a single sidewall barrier spacers 34).

The further main difference between the references applied above and the instant claim(s) is as follows: instead of using single sidewall spacers (first embodiment, fig 3 of present application), the present application, in a second embodiment (fig 5) and a third embodiment (fig 7), alternatively teaches to use double sidewall spacers by etching first and second material layers.

However, Brigham et al teach (at figs 2b-2c,3c; col 6, line 60 through col 7, line 6; cols 4-6) to form double sidewall spacers by depositing a second material layer on a first material layer and anisotropically etching the first and second layers to form double sidewall spacers, wherein Brigham expressly teaches "three or more layers of dielectric...are implemented to form a multi-layered spacer structures" (col 6, lines 1-6), and wherein silicon nitride is disclosed. Kumagai et al teach (at figs 4B-4D; col 3, line 65 through col 4, line 15) to form single sidewall nitride spacers 16 on sidewalls of a gate 14, and alternatively, forming double sidewall nitride spacers including first sidewall nitride spacers 16 and second sidewall nitride spacers 30 by anisotropically etching a deposited first material barrier layer and then anisotropically etching a second deposited material barrier layer (figs 7A-7D; col 5, line 45 through col 6).

The subject matter would have been obvious to one of ordinary skill in the art at the time the invention was made to alternatively form single sidewall nitride spacers or double sidewall spacers on the sidewalls of the gate as combinatively taught by Brigham, Kumagai, and Verhaar. This is because of the desirability to substitute and alternatively use the single sidewall nitride spacers or the double sidewall spacers as a barrier mask during oxidation to form an oxide film. This is also because of the desirability to employ the double sidewall spacers as a mask during implantation to form source and drain regions at a predetermined distance from the gate electrode.

Response to Arguments

6. Applicant's arguments filed August 08, 2002 have been fully considered but they are not persuasive, and are moot in view of new ground(s) of rejection.

7. Regarding Kurimoto references under 35 USC 102 rejection:

Applicant's remarks (8/8/02 remark page 21-22) that "Kurimoto does not teaches formation of sidewall spacer on the sidewalls of a conductive gate electrode" (as in claim 41), or "laterally adjacent the conductive gate structure's sidewalls..." as in claim 45, and "...form spacers on the sidewalls..." as in claim 50.

In response, this is noted and found unconvincing. Although there is an intervening dielectric layer, the sidewall spacers are still formed on sidewalls of the conductive gate electrode or laterally adjacent the sidewalls. The comprising-type claim does not preclude to further include such dielectric layer between them or in the common border. Applicant further remarks about "....(see Fig 8) and specification...". Claimed subject matter, not the specification, is the measure of invention. Limitations in the specification cannot be read into the claims for the purpose of avoiding the prior art. In Re Self, 213 USPQ 1,5 (CCPA 1982); In Re Priest, 199 USPQ 11,15 (CCPA 1978).

Indeed, as can be seen with newly added claims 55 and 58, wherein it is further clouded by using various claimed terms including "**on**" in claim 41, "**laterally adjacent**" in claim 45, "on" in claim 50, "**over**" in claim 54, "**adjoining**" in claim 55, "**laterally abutting**" in claim 58.

Thus, the term "...**directly**..." should be added to the various claimed terms including "on", "laterally adjacent", "laterally abutting", "abutting", "over", and "adjoining" so that without having any layer between the nitride spacers and the conductive material of the gate is clearly meant and claimed by Applicant.

8. Regarding Verhaar with Hiroki et al:

** Regarding 35 USC 102 rejection using Verhaar, with Hiroki as evidence:

Applicant's remarks about Verhaar at 8/8/02 remark pages 24-28 are noted.

In response, it is NOT disagreed with Applicant's remarks about the teachings of Verhaar, since Verhaar expressly discloses that "the regenerated by a lateral oxidation effect under the provisional spacers 20a" (col 5, lines 45-52), "a step of reoxidation of the parts of the device which are not protected by the provisional spacers 20a" (col 5, lines 28-39), "...the major part of the protective silicon nitride layer 20 is etched by anisotropic etching method...for the protection of the edges of the gate islands..." (col 5, lines 4-9), "provisional spacers are made

sufficiently thin so that the reoxidation is also effected in the lateral direction over a short distance under the spacers" (col 3, lines 31-34), etc.

Applicant remarked (at 8/8/02 remark, bridging paragraph of page 22-23) that " ...Verhaar is void of any teaching of oxidizing gate material..." , "Verhaar explicitly teaches that oxidation is limited to parts of the device.... Verhaar...does not provide any teaching, disclosure, suggestion or motivation to oxidize gate material...".

In response, this is noted and found unconvincing. First, arguendo that "Verhaar is void of any teaching of oxidizing gate material" or "Verhaar explicitly teaches that oxidation is limited to parts of the device". Under 35 USC 102 rejection, Verhaar still anticipated the claimed invention regardless of whether it is explicitly oxidizing the gate material or avoiding and teaching away from oxidizing the gate material. In other words, Verhaar already disclosed oxidation of the gate material even taught away from that oxidation.

Second, in the other hand, as applied in the office action, Verhaar discloses forming the silicon nitride spacers 20a having a thickness between 15 and 50 nm and preferably close to 30 nm (col 4, lines 63-68) adjacent to the gate electrode 12, in which oxidizing at 900°C for a duration of 15 to 30 minutes in oxygen to form a silicon oxide layer 24 (fig 5) having a thickness of the order of 10 to 15 nm (100 to 150 Angstroms), only a portion only a portion of the gate electrode 12, laterally adjacent the sidewall spacers and at the interface with the gate dielectric oxide layer 10 is inherently oxidized and creating a "smiling gate" (can be seen by enlarging the gate electrode). As shown from Figures 4 to 6 of Verhaar, after forming spacers 20a and prior to forming source and drain regions 22a,23a (Fig 6), exposing the substrate to oxidizing conditions to create a "smiling gate" (Figs 4-6). It is the fact that the present specification discloses (at page 7, lines 14-19) that only portion of the gate electrode is oxidized in a time period for growing "an oxide layer over a separate semiconductor substrate to a thickness of a round 80 Angstroms". Herein, in the absence of objective evidence to the contrary, since Verhaar grows a silicon oxide layer 24 having a thicker thickness of 100 to 150 Angstroms, only a portion of the gate electrode, laterally adjacent the sidewall spacers and at the interface with the gate dielectric oxide layer 10, is inherently oxidized ("smiling gate"). Indeed, Hiroki et al (5,512,771) evidently shows that the oxide dielectric layer 6' formed under the silicon nitride spacer 7, as a channel, to allow oxidants or oxidizing substance to transmit through it so that a portion of the

gate electrode is oxidized to form a "smiling gate" (col 12, lines 10-21; figs 6A-6B). Consequently, the burden shifted to applicant to demonstrate and prove that this apparent inherence does not in fact exist, In re King, 801 F.2d 1324, 1327, 231 USPQ 136, 138-139 (Fed. Cir. 1986).

Applicant is mistaken by asserting (at 8/8/02 remark page 28) that "...Verhaar explicitly teaches controlling these process variables in such a manner to limit oxidation ...to show exactly and only this in Figs 5-10". Since nowhere in the specification of Verhaar is expressly stated to form the device showing "exactly and only this in Figs 5-10" and controlling the processing parameters to limit what is and what is not oxidized.

** Regarding 35 USC 103 rejection using Verhaar with Hiroki :

Applicant mainly remark (at 8/8/02 remark page 29) that "Hiroki et al teach formation of an oxide layer 6 adjacent a gate structure 5b. In contrast, Applicant recites 'forming sidewall spacers comprising nitride on the gate electrode's sidewalls, the sidewall joining with the gate dielectric layer...", etc.

In response, this is noted and found unconvincing. Under 35 USC 103 rejection, the primary reference of Verhaar clearly teach that limitations.

Applicant further remark (at remark page 16) that Hiroki et al do not teach, disclose, suggest or motivate the invention as recited in any of these claims...".

In response, this is noted and found unconvincing. Hiroki et al (5,512,771) prima facie teach, suggest, or motivate to form a "smiling gate" by oxidizing a portion of the gate electrode, laterally adjacent the sidewall spacers and at the interface with the gate dielectric layer, wherein the oxide layer 6' formed under the silicon nitride spacer 7 allows oxidizing substance to transmit therethrough to oxidize a portion of the gate electrode to form a "smiling gate" (col 12, lines 10-21; figs 6A-6B). Hiroki shows the "oxide layer 6' formed under silicon nitride spacer 7 allowing the oxidizing substance to transmit therethrough to oxide a portion of the gate electrode". Therefore, it would have been obvious to ordinary skill in the art to create a "smiling gate" as taught by Hiroki et al by oxidizing a portion of the gate electrode of Verhaar. This is because of the desirability to have smaller gate-to-drain capacitance and thus to improve the speed of the circuit operation (col 8, lines 45-67; fig 2).

Applicant's previous remarks about "modification of Verhaar would render it unsatisfactory for its intended purpose" are noted and found unconvincing. In combination, by oxidizing to form a "smiling gate", *both* purposes including regenerating of the polluted silicon oxide under the nitride spacer *and* obtaining a device having smaller gate-to-drain capacitance and improved speed of the circuit operation can be obtained at about the same time in a single oxidation step.

9. Regarding 35 USC 103 rejections:

** Applicant's remarks (at 8/8/02 remark page 30) about Pintchovski are noted. First, it is not disagreed with Applicant since Pintchovski et al appears to teach (col. 1, lines 26-29) that "prevention of oxidation of the conductors is a problem to be solved", and appears to teach (at col 2, liens 38-41) that "the layer inhibits such oxidation", etc.

However, Applicant then remarked that "...the intended purpose of Pintchovski et al is destroyed in attempting *to modify the teachings of Pintchovski* et al. to try to arrive at the subject matter...". It is erroneous and found unconvincing since Verhaar or Kurimoto are the primary references. Pintchovski et al reference is cited to show the gate structure having a polysilicon layer 38, a conductive reaction barrier layer 40, and an overlying metal 42 (Figs 3a-3c; col 5, line 60 through col 6, line 45). Thus, it would have been obvious to one of ordinary skill in the art to modify the gate structure of Verhaar by employing the Pintchovski's gate structure having a polysilicon layer, a conductive reaction barrier layer, and an overlying metal. This is because of the desirability to fabricate high speed devices due to high conductivity of the gate electrode, wherein the conductive reaction barrier layer also acts as a diffusion barrier.

** Applicant's remarks (at 8/8/02 remark pages 30-31) about Brigham and Kumagai et al are noted.

First, it is not disagreed with Applicant that Brigham et al teach "the formation of 'reox' oxide layer 24 or 34...", and it is not disagreed with Applicant that Kumagai et al teach the formation of "short channel LDD MOSFETS....".

Applicant remarked that "...the intended purpose of Brigham et al is destroyed in attempting *to modify the teachings of Brigham* to try to arrive at the subject matter..." and

"...there is no motivation...to attempt *to modify the teachings of Kumagai et al* to try to arrive at the subject matter...". It is found unconvincing and erroneous since Verhaar or Kurimoto are the primary references. Brigham and Kumagai are cited to show the formation of the single spacer, L-shaped double sidewall spacers by etching first and second material layers, and double sidewall spacers by depositing and anisotropically etching the first material layer and then depositing and anisotropically etching a second material layer. Thus, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify Verhaar or Kurimoto to alternatively form single sidewall nitride spacers or double sidewall spacers on the sidewalls of the gate as combinatively taught by Brigham, Kumagai, and Verhaar. This is because of the desirability to substitute and alternatively use the single sidewall nitride spacers or the double sidewall spacers as a barrier mask during oxidation to form an oxide film. This is also because of the desirability to employ the double sidewall spacers as a mask during implantation to form source and drain regions at a predetermined distance from the gate electrode.

*** Applicant's demonstrations, remarks and criticism of the office action are noted and found unconvincing. Rejections, reasons and responses of record are outstanding, well meaningful and maintained, although they are disagreed with by Applicant.

****

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

*** Any inquiry concerning this communication or earlier communications from the examiner should be directed to Michael M. Trinh whose telephone number is (703) 308-2554. The examiner can normally be reached on M-F: 8:30 Am to 5:00 Pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Whitehead Jr Carl can be reached on (703) 308-4940. The fax phone numbers for the organization where this application or proceeding is assigned are (703) 308-7722 for regular communications and (703) 308-7724 for After Final communications.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is (703) 308-0956.
